3.4: System Failures and Corrective Actions

The latest inspection of the drinking water facility took place on [February 13, 2024](#). The facility scored [0/444](#) providing a rating of [100%](#).

The following non-compliances were reported to the MECP during the reporting period.

On Friday April 19, 2024 at 15:00, Operators discovered an issue with the filter turbidity analyzers upon completing rounds and reviews before the weekend. It was noted there was no flow going through any of the turbidity analyzers. Therefore, it is assumed turbidity was not being analyzed for the runtime that occurred between 13:18 and 15:24. An on-call Operator had been on-site for high turbidity call outs on April 18 and earlier in the day on April 19, at the time the analyzers were dirty and had little flow. After cleaning and flushing the analyzers, flow seemed to improve and the LLP shutdown due to the clearwell full level being reached. It wasn't until they returned to the site at 15:00 that they realized there was no flow into the analyzers during production. The on-site Operator notified management, PCTs and the ORO of the issue at 16:45. PCTs provided direction to management at 17:03 stating turbidity readings must be taken every 15min while the filters are in production. This was then communicated to the onsite and on-call Operators.

However, turbidity readings were not taken during the following filter run times: April 19 beginning at 17:18 ending at 20:37 and April 19 beginning at 21:55 ending April 20 at 01:48. The on-call Operator was onsite for all the remaining filter run times on Saturday April 20, Sunday April 21 and the morning of Monday April 22. The regular facility Operator, was able to fix the issue with the analyzers on April 22. There were no additional filter runtimes in which turbidity was not being monitored according to the requirements stated in Reg 170.

On September 22 @ 16:14 an alarm was received for PLC communication failure. When the Operator arrived onsite, they could not find the source of the alarm and at the time all operations seemed normal. The Operator received another alarm on September 24 for a filter #1 fault alarm. While troubleshooting the issue, they discovered there was no power to the filter control panel and a breaker was tripped. Nor-tech was brought onsite and they found the breaker itself was broken, they were able to use a spare breaker to correct the issue. After this was complete, the Operator noted the PLC communication alarm cleared. After completing the 72hr data review, the Operator discovered the filter #1 turbidity data had flat lined at 0.04NTU due to the faulty breaker. The actual turbidity data was not recorded from September 22 @ 16:14 to September 24 @ 18:08. As a result of this a loss of data was reported for this timeframe.

The fluoride analyzer at the Espanola WTP has been inoperable since June 2024. In order to meet requirements of Reg 170, daily bench top residuals were to be recorded. The fluoride system is only being used during the Operator's regular scheduled work week. The Operator turns on the system when they arrive Monday morning and shuts it down Friday before leaving. On December 9th, the Operator missed taking a fluoride residual. On Friday December 13th, the Operator forgot to turn off the fluoride feed system and therefore residuals were missed on Saturday December 14th and Sunday December 15th. A residual was collected on December 16th with a result of 0.78mg/L.

4.2: Facility Description

The source of raw water for the Espanola Drinking Water System is Lake Apsey where the intake is located 135 m from shore at a depth of 12m.

The facility includes two solids contact clarifiers, three dual media filters, a clearwell, a pumping station with low lift pumps, three high lift pumps, two backwash pumps, backwash water holding tank with pumps discharging to the sanitary sewer system.

As raw water enters the facility, potassium permanganate is added to improve oxidation of iron and manganese. Alkalinity is boosted and pH is adjusted prior to coagulation and flocculation. After the water is through the reactivator clarifiers and 3 dual media filters, sodium hypochlorite is added for disinfection and hydrofluosilicic acid (fluoride) is added to the water. The water is then pushed through into the facility's reservoir. PH levels are again adjusted and then fed to the 2 clearwells. Prior to entering the distribution, polyphosphates (corrosion control) and sodium hypochlorite is added. The system is equipped with a 275KW diesel generator on site for emergency power.

The distribution includes an elevated storage tank, 5 bleeders with backflow prevention (air gap), a continuous chlorine analyzer and approximately 150 hydrants.
